COMPANY PROFILE

Much of ARB's success as a bearing manufacturer is largely due to its passionate pursuit of quality at lower cost.

With a tremendous focus on manufacturing quality bearings and restraints on cost, it comes as no surprise that ARB Bearings is among India's prominent engineering companies. Headquartered at Delhi, the company was incorporated in 1990. It has 3 manufacturing plants in and around Delhi with more than 1000 employees working. ARB Bearings is run by professionals with over forty years of experience in the bearing industry. Within a short duration since inception, the company has carved a niche for itself in various segments ranging from automobiles to industrial machinery to household appliances.

ARB Bearings is exporting its products in more than 35 countries in the world. With Government Dept., State Transport, Ministry of Defence and overseas buyers as its clients, it is also keeping the wheels of the national economy running.

INTERNAL CLEARANCE

The bearing internal clearance is defined as the total distance through which one bearing ring can be moved relative to the other under zero measuring load. Movement in the radial direction is called radial internal clearance; axial movement, axial internal clearance. The internal clearance is standardized.

Rolling bearing are delivered with different internal clearance. The internal clearance will vary from bearing type the most common clearance is NORMAL (with no suffix).

C1- Bearing internal clearance smaller than C2

C2- Bearing internal clearance smaller than normal

C3- Bearing internal clearance greater than normal

C4- Bearing internal clearance greater than C3

C5- Bearing internal clearance greater than C4

Why internal clearance ?

1. In order to fit a bearing tightly on a shaft it is necessary that the shaft is slightly larger than the bore of the inner ring. When the bearing is mounted, the inner ring will be expanded and consequently the space available for the rolling elements will be reduced. The reduction in space available for rolling elements when the bearing is mounted is accommodated by internal clearance.

2. Steel will expand with increased temperature. In operation the temperature of the various parts of a bearing will not remain uniform and resulting in varying degrees of expansion which is compensated by the internal clearance. The internal clearance required is dependent upon the mounting fit and the operation conditions. In case of doubt a bearing with greater clearance shall always be selected.
